

Saifallah Ehab Ibrahim

AI Student | Aspiring AI Engineer | Software & Web Developer

Egypt | +20 101 695 5559 | saifsaadawy5@gmail.com | github.com/Saifsaadawy | linkedin.com/in/saif-saadawi

PROFESSIONAL PROFILE

Artificial Intelligence student at Helwan University with a broad software-development background spanning Python, Java, JavaScript, SQL, web development, algorithms, databases, and application development. Focused on developing into an AI Engineer capable of taking a problem from requirements and data through algorithmic reasoning, implementation, testing, and deployment-oriented software practices. Hands-on work includes intelligent-assistant concepts, algorithm simulations, database systems, responsive web applications, and programming exercises. Comfortable learning new technologies, breaking complex problems into smaller components, debugging implementation issues, and building practical solutions rather than relying only on theoretical knowledge.

TECHNICAL SKILLS

Programming Languages: Python, Java, JavaScript, SQL, PHP, HTML5, CSS3

Artificial Intelligence: Artificial Intelligence, Machine Learning, Deep Learning, Data Science, AI application development concepts

Python Development: Python programming, Object-Oriented Programming, problem solving, algorithm implementation, debugging, automation concepts

Web Development: Front-End Development, Back-End Development, Responsive Web Design, Flask, REST APIs, UI implementation

Algorithms & Computer Science: Algorithms, Data Structures, Algorithm Analysis, Recursion, Scheduling Algorithms, Object-Oriented Programming, Software Engineering

Databases: SQL, SQL Server, relational database concepts, structured data management, database-driven applications

Development Tools: Git, GitHub, Visual Studio Code, Docker, Linux

Development Practices: Debugging, testing, version control, code organization, problem decomposition, responsive development, cross-browser compatibility

PROFESSIONAL EXPERIENCE

Freelance Frontend Developer — DebugZ

20 Sep 2026 – Present

- Develop and refine interactive web interfaces based on client requirements, with attention to usability, structure, responsiveness, and visual consistency.
- Translate design ideas and functional requirements into practical front-end implementations using modern web technologies.
- Build responsive page layouts that adapt across desktop, tablet, and mobile screen sizes.
- Implement interactive UI elements and animations while maintaining a clean and usable interface.
- Work through browser and device compatibility issues and troubleshoot front-end behavior during development.
- Review existing interfaces to identify layout, usability, performance, and implementation issues and apply targeted improvements.
- Maintain and update web interfaces as requirements change, keeping the code organized and easier to modify.
- Apply practical debugging and testing techniques to identify problems before delivery.
- Communicate technical implementation details in a way that connects client requirements with achievable software solutions.

Python Trainee — CodeAlpha

20 Sep 2026 – 20 Oct 2026

- Strengthen Python programming fundamentals through structured learning, practical exercises, and hands-on programming tasks.
- Apply variables, control flow, functions, data structures, and core Python programming techniques to practical problems.
- Practice Object-Oriented Programming and organize solutions around reusable classes, methods, and logical components.
- Write Python solutions, test their behavior, identify errors, and debug implementation issues.
- Work through programming problems by breaking requirements into smaller logical steps before implementation.
- Improve code readability and maintainability through structured programming and clearer organization.
- Use practical exercises to develop problem-solving skills and become more comfortable translating requirements into working Python code.

SELECTED TECHNICAL WORK

The portfolio includes multiple categories of technical work rather than a single project track. This includes AI-assistant development, algorithmic problem solving, operating-system scheduling simulations, database-backed applications, web development, and Java-based application development. Across this work, the focus has been on implementing functionality, understanding how different software components connect, testing behavior, and improving solutions through debugging and iteration.

AI & Automation

Development of a Jarvis-style personal AI assistant concept using Python, with emphasis on voice interaction, automation, and intelligent task execution.

Algorithms & Problem Solving

Implementation and comparison of algorithmic solutions, including recursive versus non-recursive approaches and scheduling algorithms such as Priority Preemptive and SRTF.

Database & Application Development

Development of structured applications using Java and SQL, including reservation workflows and database-driven functionality.

Web Development

Creation of responsive web interfaces and web applications using HTML, CSS, JavaScript, Flask, and related back-end concepts.

PROJECTS

Personal AI Assistant — Jarvis

Python • AI • Automation

Python-based personal assistant concept focused on voice interaction, automation, and intelligent task execution. The project represents the direction of the user's longer-term AI Engineering development.

P2P Specialized Tool Library

JavaScript • PHP • Web

Web-based specialized tool library system involving structured tool-related workflows and web functionality. Repository: github.com/Saifsaadawy/P2P-Tool-Library.

Hotel Reservation System

Java • SQL

Java and SQL application focused on hotel reservation workflows and structured database management.

Job Landing Page

HTML • CSS • Flask

Responsive job-portal landing page focused on interface structure, responsive design, and web application organization.

Max Product of 3 Numbers — Recursive vs Non-Recursive

Python • Algorithms

Algorithm implementation comparing recursive and iterative approaches for the maximum product of three numbers, with attention to computational complexity.

Priority vs SRTF Scheduling Comparison

Python • Algorithms

Operating-system scheduling simulation comparing Priority Preemptive and Shortest Remaining Time First, including Gantt charts and performance statistics.

EDUCATION

B.Sc. in Computers and Artificial Intelligence — Helwan University

AI Specialization • Expected Graduation: 2028

Academic focus includes Artificial Intelligence, programming, algorithms and data structures, software engineering, databases, and core computer science concepts.

CERTIFICATION

Python Programming Certificate — New Horizons

September 2026 • Python Programming

CURRENT AI ENGINEERING DIRECTION

Building toward AI Engineering through progressive study and implementation of Python, algorithms and data structures, machine learning, deep learning, automation, and intelligent applications. The long-term direction is to combine strong software-engineering fundamentals with AI capabilities to build practical end-to-end systems.
